Project Planning

What I Want to Build

I want to build a hymn transliteration app/website to help members of my church read hymns more easily. The app will support Ge'ez, Amharic, and Tigrinya by converting the text into English letters (Latin script) based on pronunciation, making it easier to read without directly translating the meaning. The idea came from my experience as a member of my church choir. I've seen that choir leaders spend a lot of time manually writing hymns in English letters so that people who cannot read Ge'ez, Amharic, or Tigrinya can still pronounce and sing them correctly. With this app, users could simply paste or type a hymn, prayer, or other church text, and it would automatically transliterate it into English letters. This would save time and make church materials much more accessible. Many of the students and children at my church can only read English letters, so they often struggle to follow along with hymns, prayers, and other church materials. By providing an easy way to read these texts using English letters, this app would help more people participate confidently in church services and choir activities.

Pseudocode

- Start the app
- Ask the user to choose a language:
 - Amharic
 - Tigrinya
 - Ge'ez
- Ask the user to type a word or sentence
- Check the letters in the user's input
- Change the original letters into matching English letters
- Display the new words written with English letters
- Let the user try another word or sentence
- End the app when the user chooses to quit

Questions I Have

- How do I make it into an app/website
